

Exhibit A

At **page 5**, please rewrite the first full paragraph as follows:

Intra-cardiac signals are commonly acquired for electrophysiology studies via a selected pair of a catheter's electrodes. The catheter is said to be used as a bi-polar probe when a cardiac signal is obtained between any pair of its electrodes. In some electrophysiology studies or cardiac mapping, however, the catheter is used as a uni-polar probe. When catheters of the prior art have been employed as a uni-polar probe, an additional reference electrode, that is not a part of the inserted catheter, is needed to complete the electrical circuit path. In such an arrangement, a second catheter is transvenously placed into the heart and this second catheter electrode function as the reference electrode. **U.S. Patent No. 4,920,980** describes uni-polar and [bio-polar] bi-polar application of cardiac catheters.

At **page 6**, please rewrite the first full paragraph as follows:

Typically, the main body of these catheters comprises a flexible tube constructed from polyurethane, nylon or some other electrically non-conductive flexible material with braided steel wires or other non metallic fibers in its wall as [re-enforcing] reinforcing elements. An early example of such construction is that shown and described in **U.S. Patent 3,416,531** issued to M.L. Edwards. Catheters of this type are available in two general categories: **a)** those having a non-deflectable distal portion, an example of which is shown and described in **U.S. Patent 3,190,286** issued to R.W. Stokes, and **b)** those having a deflectable distal portion, as for example in the catheter shown and described in **U.S. Patent 3,605,725** issued to I.E. Bentov. The distal portion of the deflectable type catheters is typically made from non-braided flexible tube. This portion can be deformed into a variety of curved configurations with different radii of curvature by means of user input to a manual actuator on the catheter handle. The actuator is commonly internally linked to the catheter distal portion or the tip electrode by at least one steel tension or pull wire.

At page 9, please rewrite the second paragraph as follows:

In the aforesaid U.S. Pat. 5,273,535 issued to [Edward et al] Edwards, et al., a catheter is disclosed with two manual actuators on the catheter handle; one actuator is employed for formation of curvature at the distal portion of the catheter; and, the other actuator is used for retention of curvature or locking. This catheter requires two independent manual actions on both actuators in order to form and retain a desired radius of curvature on the distal portion of the catheter. Therefore, the [Catheter] catheter of U.S. Patent 5,273,535 (Edwards, et al.) fails to satisfy a simultaneous curvature formation and curvature retention at the distal portion of the catheter by a single action of the [operators] operator's hand.

At page 23, please rewrite the first paragraph as follows:

Figure 42 is a view similar to Figure 40 show in an alternate embodiment of the distal end of [te] the catheter of Figure 40;

At page 23, please rewrite the third paragraph as follows:

Figure 44 is an enlarged view of the proximal end of [te] the catheter of the present invention illustrating the attachment of the tension/compression members to the sliders;

At page 23, please rewrite the fourth paragraph as follows:

Figure 45 is a longitudinal section view of an embodiment of the invention employing a self positioning friction brake for the actuator of [te] the handle;

At page 23, please rewrite the sixth paragraph as follows:

Figure 47 is a schematic view of the sliders of the handle of [he] the present invention showing a displacement transducer;

A

At page 23, please rewrite the seventh paragraph as follows:

Figure 48 is a perspective view of the catheter of the present invention employing a collar thereon for enabling a user to apply torque to the braided outer casing tube of [te] the catheter;

At page 24, please rewrite the first paragraph as follows:

Figure 51 is a view of [te] the step subsequent to the step of Figure 50;

At page 27, please rewrite the first full paragraph as follows:

Figure 4 shows an enlarged sectional view of the pull/push mechanism of the catheter handle 4. The proximal end of the inner guide tube 9 is seated on the catheter handle nose 15 [which] that is attached to an end block or body 113 of handle 4. The tension/compression members 11['] and 12['] are each fixed at one end to the distal end of the guide tube 9 in the region 10. The other end of each of the tension/compression members 11 and 12 is attached to one of the push/pull length adjuster units 16 and 17 [which] that are slidably mounted in grooves on slots 114, [115] 114' mounted in block 113. With this arrangement, the distal portion 10 of the inner guide tube 9 can be formed into a curved configuration by user movement of the manual actuator member 18 in either transverse direction as indicated by the dashed outline in Figure 4 about pivot point 19 by which actuator 18 is mounted to block 113 in a through-slot 116.

At pages 42-43, please rewrite the paragraph that bridges these pages as follows:

Referring to Figure 21, the external electrical connector 186 of actuator subassembly 182 of [Figure] Figures 20b, 20c, and 20d is shown where each of the ring electrical connectors 186 has an end of one of the lead wires 230, 232, 234, 236, attached thereto. It will be understood [tat] that each of the leads 230-236 has its opposite end connected to one of the connectors 184 externally of handle 182.

At page 48, please rewrite the second paragraph as follows:

Referring to Figures 21 and 32, another embodiment of [thee] the invention is indicated generally at 300 and has a solid distal electrode that in the present practice of the invention has been formed satisfactorily from platinum material and is denoted by reference numeral 302. The electrode 302 has the distal ends of a pair of tension/compression members 304, 306 secured therein as, for example by weldment, which in the present practice of the invention comprises a brazed joint 308. It will be understood that the distal portions of the tension/compress members 304, 306 have generally flattened rectangular transverse cross-sections as illustrated in Figure 32.

At page 49, please rewrite the first full paragraph as follows:

It will be understood that the tension/compression members' transition to a round or wire-like configuration is denoted by reference numeral 304', 306' in a manner similar to the embodiment of [Figure] Figures 2b and 3a of the present invention. In [te] the embodiment of Figures 31 and 32, a thin wall plastic tubing 318 is received over the distal flattened portions of the tension/compression members 304, 306 and the plastic tube is received over, in closely fitting arrangement, an annular sleeve or collar 320 secured to the weldment or brazed joint of the distal electrode. In the present practice of the invention, the collar 320 is formed of stainless steel material. The plastic tube 318 extends over the round cross-section portion 304', 306' of the tension/compression members; and, the tube 318 also extends over the distal end of an inner guide tube 322 [wich] which in the present practice of the invention comprise a closed coil stacked helical spring member.

At page 49, please rewrite the second paragraph as follows:

A thin wall preferably stainless steel tubular member 324 is received over the tension/compression members 304', 306' and the tube 324 has one end thereof crimped to a flattened cross-section as denoted by reference numeral 326 and the member 324 serves to constrain the tension/compression member from twisting or rotation with

A

respect to the outer casing 325 and 330 during flexing of the distal portion of the catheter. An outer blood-contacting casing comprising a tubular flexible plastic member 325 has the distal end thereof [is] attached to a reduced diameter portion [os] of the distal electrode 302 and extends over the tube 318 and has the opposite end thereof received over a [thin wall] thin-wall relatively short annular sleeve member 328 [which]. Sleeve 328 serves to join the outer casing member 325 with the outer casing 330 that is [re-enforced] reinforced with braided material as denoted by reference numeral 332. With reference to Figure 31, a plurality of annular electrodes are received over the periphery of the casing member 325 and are disposed in spaced arrangement therealong with each of the electrodes having an electrical wire lead member connected thereto as denoted by reference numerals 334, 336 for the electrodes and 338, 340 for the wire leads in Figure 31.

At page 50, please rewrite the first paragraph as follows:

It will be understood that the catheter 300 is intended to be operated by the handle mechanism illustrated in Figure 1 wherein the slider members are connected to the tension/compression members 304, 306 such that movement of the actuator causes one slider to tension one of the members 304, 306 and the other of the members is placed in compression; and, reversed movement of [te] the actuator wherein the handle causes the other of the tension/compression members to be tensioned and the one to be placed in compression.

At page 50, please rewrite the second paragraph as follows:

Referring to [Figure] Figures 33 through 37, another embodiment of the electrophysiology/ablation catheter of the present invention is indicated generally at 400 and has a construction generally identical to [tat] that of the catheter 300 of Figure 31, with the exception that the inner guide tube 302 is formed of plastic material and has two generally circular longitudinally extending lumens 404, 406 formed thereto to which are received the tension/compression members 408, 410.

At page 50, please rewrite the third paragraph as follows:

It will be understood that in the embodiment 400, [a] tension/compression members 404, 406 have flattened distal portions 404', 406' as illustrated in [details] detail in Figures 36 and 37; and, the embodiment 400 also employs the spacer means comprising a wave-shaped flat spring 416 with one end thereof secured in a kinematic junction 426 in a manner identical to that of embodiment 300 of Figure 31.

At page 51, please rewrite the first paragraph as follows:

Referring to Figure 39, the central lumen is denoted by reference numeral 420 and the side lumens are denoted by reference numerals 422 and 424. In the embodiment 400, the annular tube member forming the kinematic junction is denoted by reference numeral 426; and the outer casing portion having [te] the electrodes thereon is denoted by reference numeral 428 and the braided portion of the outer casing is denoted by reference numeral 430 and the distal electrode is denoted by reference numeral 432.

At page 52, please rewrite the second paragraph as follows:

The embodiment 600 of Figure 41 also includes a temperature sensor 616 embedded in the distal electrode 602, which [is] in the present practice of the invention may be a solid state junction device which has leads 618, 620 extending within the casing 610 to the proximal end of the catheter. The sensor 616 is intended for use in remote monitoring of the temperature of the distal electrode 602 during ablation procedures.

At page 52, please rewrite the third paragraph as follows:

Referring to [Figure] Figures 42 and 43, an alternate version of the embodiment 600 is illustrated wherein the catheter assembly indicated generally at 700 [as the construction thereof] is identical to the embodiment 600 with the exception that the catheter [of] 700 does not include a heating element in its distal electrode 702; and

A

instead, the temperature of the distal electrode 702 is controlled by a radio-frequency power supply/control module that is external to the catheter [of] 700.

At pages 52-53, please rewrite the paragraph that bridges these pages as follows:

Referring to Figure 44, another embodiment of the catheter handle is indicated generally at 800 and has the proximal end of the guide tube 802 received in a tubular member 804 in a closely fitting arrangement with the tension/compression members 806, 808 extending from the proximal end of [te] the guide tube 802 and through the tube member 804 for connection to a pair of slider blocks 810 and 812 which corresponds in shape and function to the sliders 16 and 17 of Figure 5. The proximal ends of each of the tension/compression members 806, 808 each have a closely fitting thin wall preferably stainless steel tube 814, 816 received respectively thereover.

At pages 54-55, please rewrite the paragraph that bridges these pages as follows:

Referring to [Figure 48] Figures 49 through 54, the technique for installing one of the annular electrodes over the outer casing at the distal portion of [te] the catheter is illustrated and will be described hereinafter with respect of Figures 49 through 54. Referring to Figure 49, an annular electrode 1000 has an electrical conductive lead 1002 attached to the interior periphery thereof and extending outwardly therefrom. The flexible outer casing tubing 1004 has an end thereof received over a rigid tubing such as 1008 which serves as a part of a holding vise for the tubing 1004.

The free end of the electrical lead 1002 is then passed through an aperture 1006 on the flexible outer casing tube 1004 and then is passed outwardly through the end of the tubing 1008 as shown in Figure 50.

A
